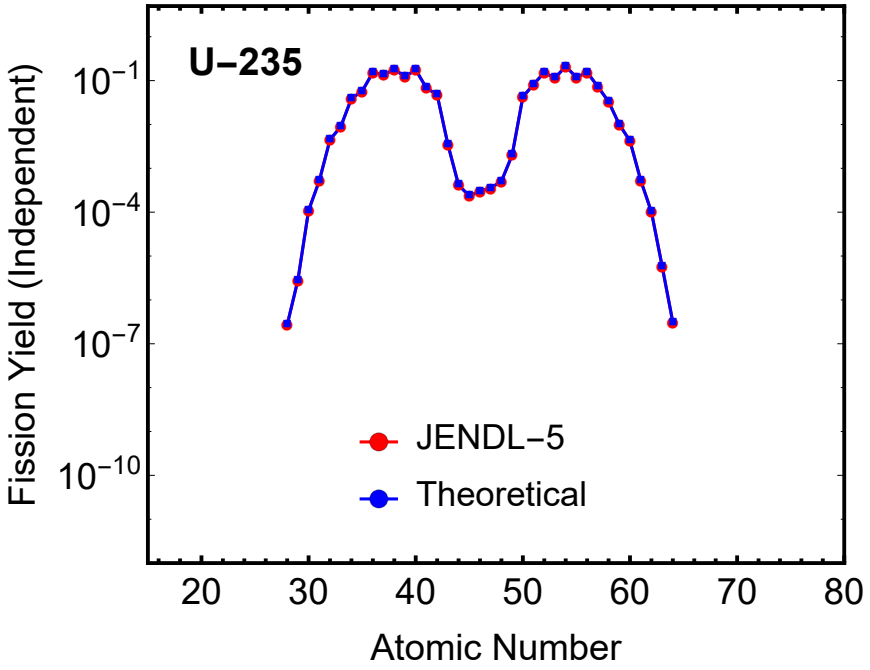
1. Incident Neutron Energy: 0.0253eV: Effective Fission Distance Reff derived from experimental charge distribution

Analysis Results

Calculation results demonstrating that the effective fission distance Reff derived from optimization calculations accurately reproduces experimental values (confirming agreement between JENDL-5 experimental and theoretical values, and validating calculations using Mathematica ver11.2 FindMinimum)

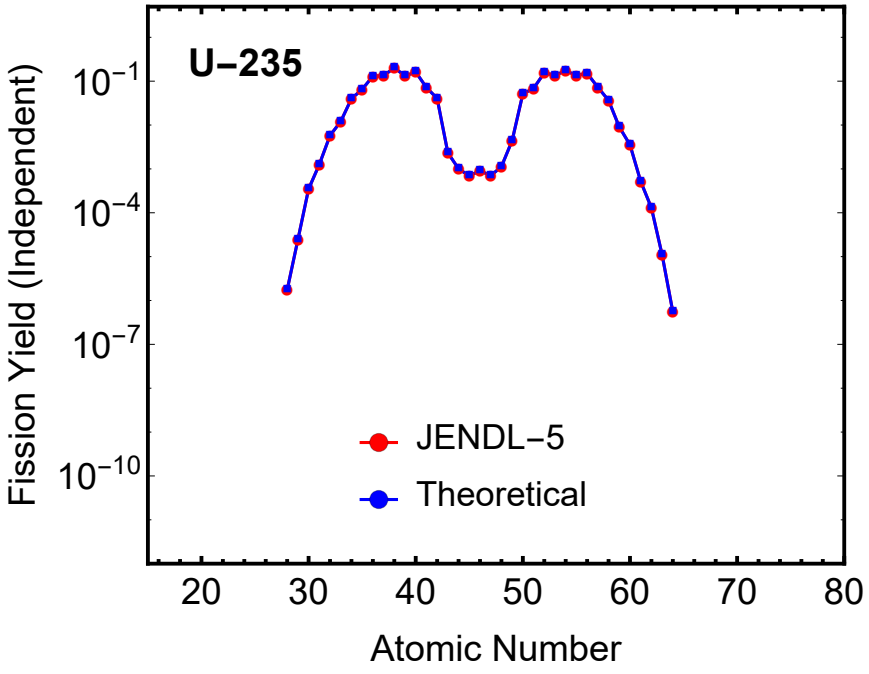


---

2. Incident Neutron Energy: 500keV: Effective Fission Distance Reff derived from experimental charge distribution

Analysis Results

Calculation results demonstrating that the effective fission distance Reff derived from optimization calculations accurately reproduces experimental values (confirming agreement between JENDL-5 experimental and theoretical values, and validating calculations using Mathematica ver11.2 FindMinimum)

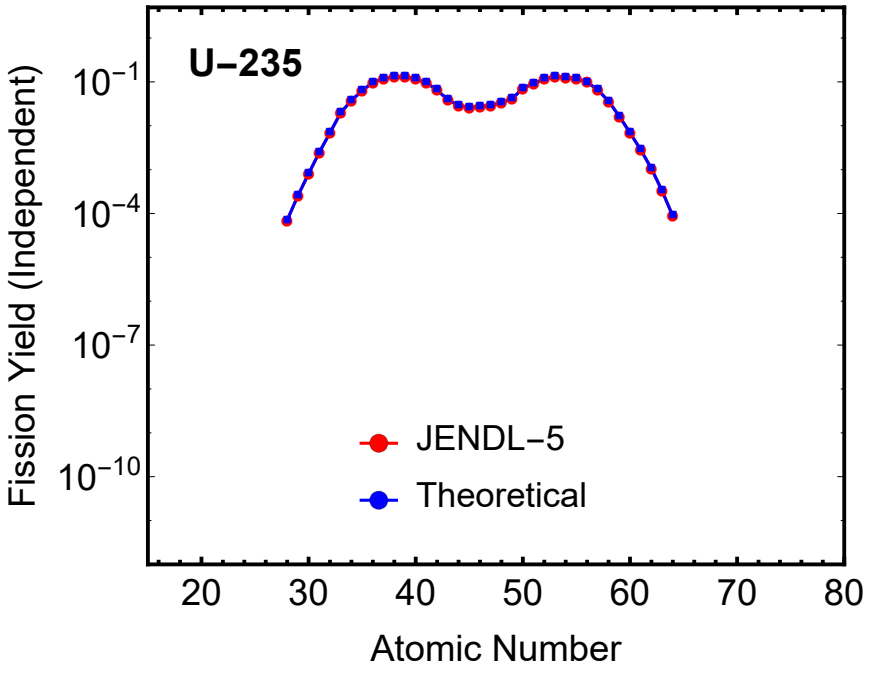


---

3. Incident Neutron Energy: 14MeV: Effective Fission Distance Reff derived from experimental charge distribution

Analysis Results

Calculation results demonstrating that the effective fission distance Reff derived from optimization calculations accurately reproduces experimental values (confirming agreement between JENDL-5 experimental and theoretical values, and validating calculations using Mathematica ver11.2 FindMinimum)

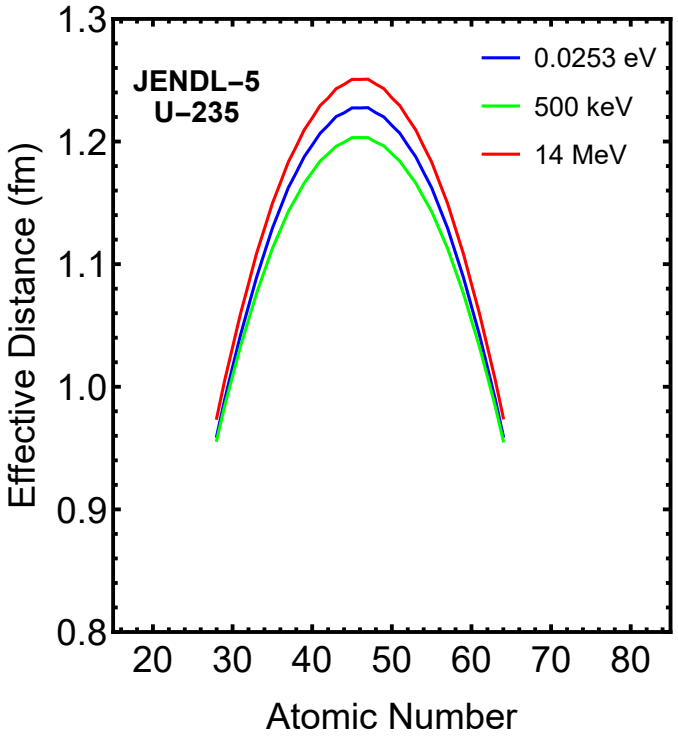


Analysis Results:

1. The effective fission distance Reff shows quadratic dependence on fragment charge

2. This dependence reflects fundamental laws of charge distribution in fission process

3. Similar dependence is maintained across different incident energies



Incident Neutron Energy: 0.0253 eV case

$$Reff == -0.517291 + 0.000824625\,(92.0016 - x)\,x$$

Incident Neutron Energy: 500 keV case

$$Reff == -0.402801 + 0.00075919\,(91.9902 - x)\,x$$

Incident Neutron Energy: 14 MeV case

$$Reff == -0.548523 + 0.000850272\,(92.0048 - x)\,x$$

Analysis Results:

1. The effective fission distance Reff shows quadratic dependence on fragment charge number

2. This dependence reflects fundamental laws of charge distribution in the fission process

3. Similar dependence is maintained across different incident energies

Table of Effective Fission Distance (Reff) Values by Atomic Number [Unit: fm]:

Displaying calculated values (pre-fitting) and post-fitting values for each energy

Fitting calculation used fragment values from atomic number 28 to 64

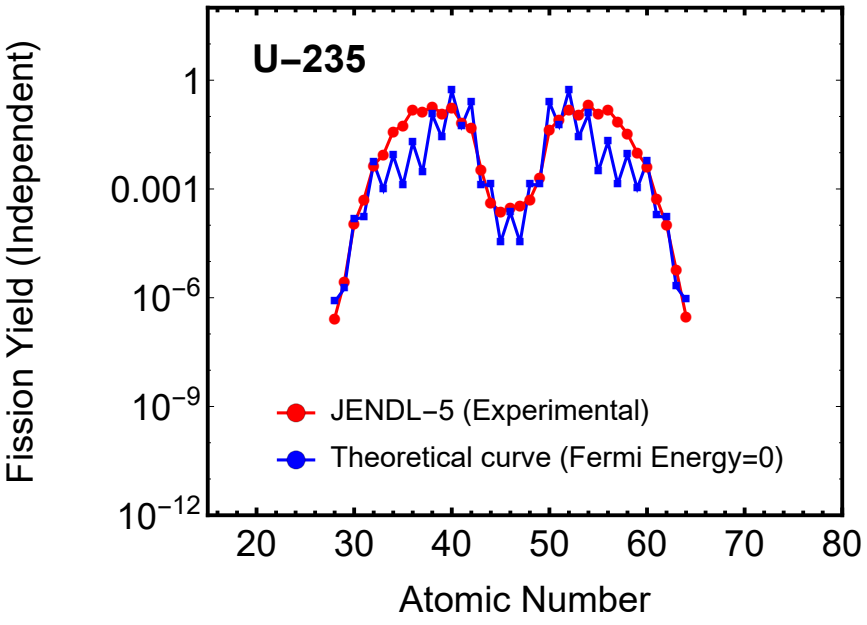
Analysis of Fission Yields: Comparison
between Experimental Data and Theoretical Calculations (Ex=0)

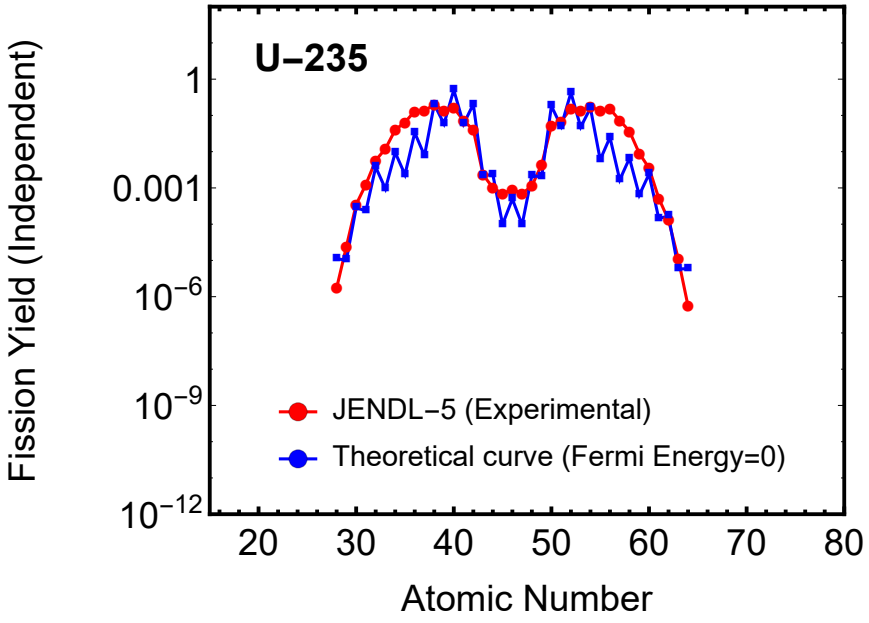
Theoretical Analysis Results using Effective
Fission Distance Reff proportional to fragment charge product,
with zero Fermi Energy (Ex=0)

- Quantitative reproduction of experimentally observed asymmetric fission yield distributions

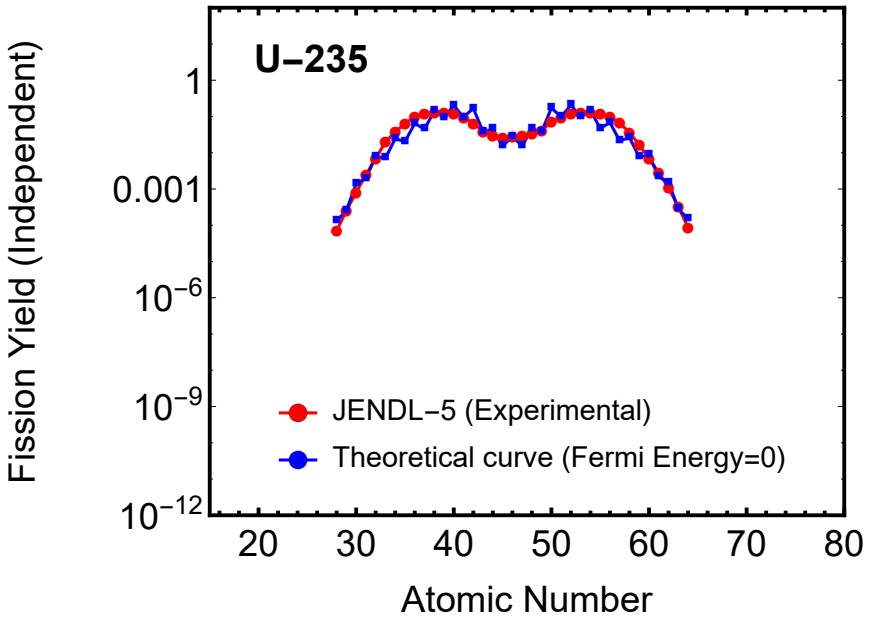
1. Analysis for Incident Neutron Energy: 0.0253eV



2. Analysis for Incident Neutron Energy: 500keV



3. Analysis for Incident Neutron Energy: 14MeV

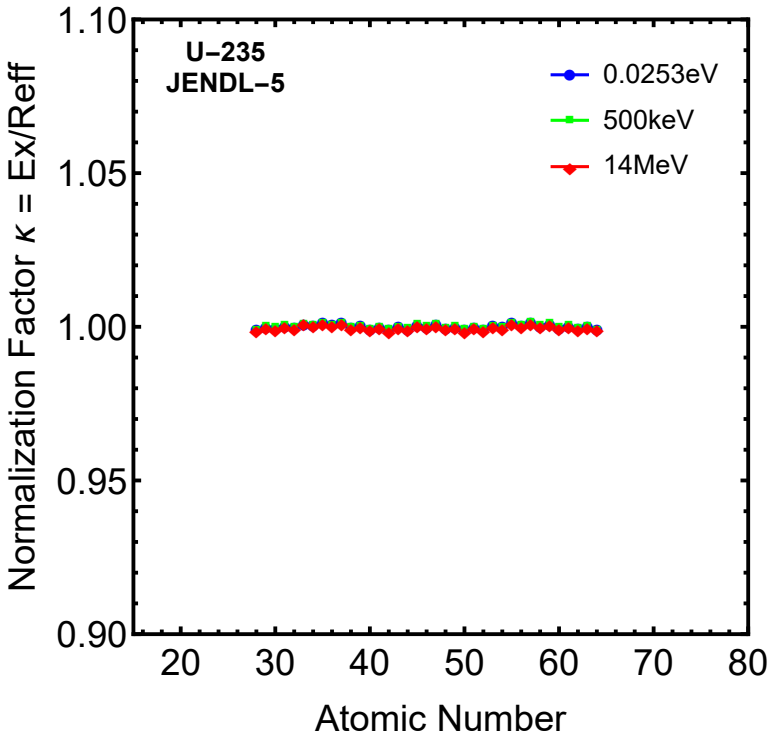


Analysis of Effective Fission Distance and Fission Probability

Analysis Contents:

1. Calculation of Effective Fission Distance (Reff) for each incident neutron energy
2. Evaluation of fission probability using η function
3. Derivation of normalization factor κ (= Ex/Reff)

The vertical axis κ represents the ratio of Fermi Energy(Ex)
to effective fission distance (Reff).
$\kappa \approx 1$ suggests the fission Fermi Energy is proportional to effective distance.



Theoretical Analysis and Experimental Comparison of Fission Yield Distributions

Calculation Process:

1. Evaluate logarithmic differences
   between JENDL-5 experimental data and theoretical calculations
2. Optimize Fermi Energy (Ex) using least squares method
3. Generate theoretical curves using optimized Ex
4. Compare and verify experimental vs theoretical values

Optimization Goals:

- Theoretical reproduction of experimentally observed asymmetric fission yields
- Understanding fission mechanisms at each incident neutron energy
- Systematic determination of Fermi Energy (Ex)

Evaluation Methods:

- Minimize sum of squared logarithmic differences between theory and experiment
- Parameter optimization using FindMinimum function
- Validation of theoretical curves with optimized parameters

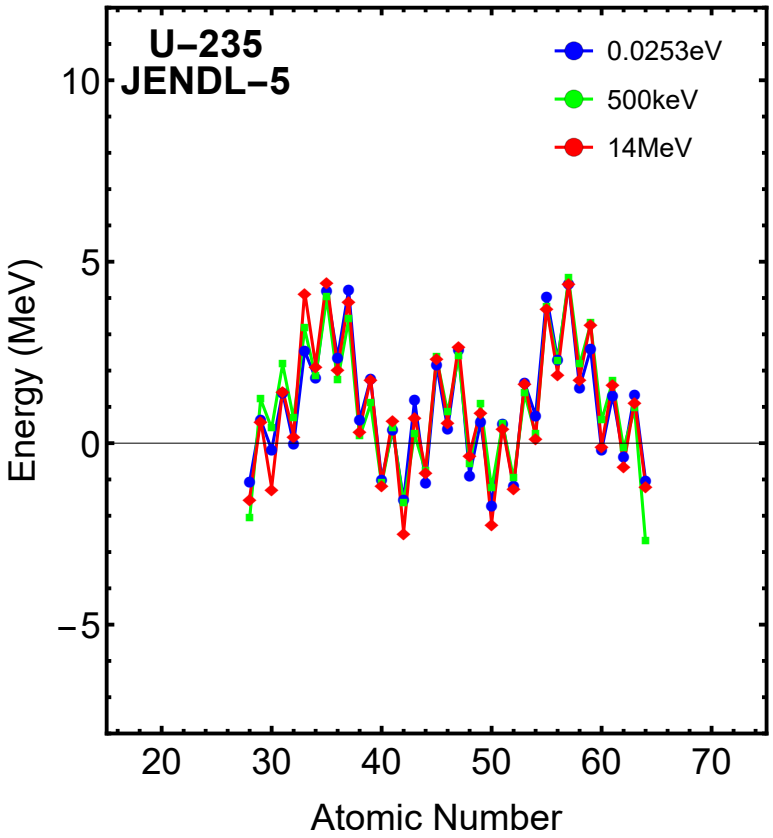
Systematic Analysis Results of Fermi Energy Ex

Using Optimized Effective Fission Distance Reff



1. Analysis for Incident Neutron Energy: 0.0253eV

Secondary Fragment: rubidium(Z=37); Yield: 4.228 MeV

Primary Fragment: cesium(Z=55); Yield: 4.03811 MeV

Average Peak Yield: 4.13305 MeV

---

2. Analysis for Incident Neutron Energy: 500keV

Secondary Fragment: cesium(Z=55); Yield: 3.73865 MeV

Primary Fragment: rubidium(Z=37); Yield: 3.40225 MeV

Average Peak Yield: 3.57045 MeV

---

3. Analysis for Incident Neutron Energy: 14MeV

Secondary Fragment: rubidium(Z=37); Yield: 3.94837 MeV

Primary Fragment: cesium(Z=55); Yield: 3.74489 MeV

Average Peak Yield: 3.84663 MeV
